- Vizilite Oral Cancer screening only \$55 Reg \$65
- Rotadent kit (Rotary toothbrush, Fluoride Toothpaste and Chlorhexidine rinse) only \$99.99 Reg \$180

Fight with the light—Vizilite : Dr. Dagli

Oral cancer is one of the deadliest forms of the disease. Because almost 70% of all oral cancer victims are diagnosed in

the later stages, the five-year survival rate is only 50%. But the survival rate skyrockets to 90% for oral cancers discovered in their early stages. This is why we're very proud to introduce a new state-of-the-art screening technology called Vizilite™ Plus to our practice. An annual Vizilite Plus examination, following our standard oral cancer check, will provide our patients with the most comprehensive oral cancer screening possible.

First, Vizilite is a simple, painless, and non-invasive device that helps us de-

tect what we can't see with unaided eyes. With Vizilite, we can evaluate and monitor suspicious areas at their earliest stages before there is any progression toward life-threatening conditions. Once Vizilite has identified an area that requires closer examination, we can apply TBlue630™, a special pearlescent agent that can be seen under normal light. This allows us to further evaluate and closely monitor any change. With Vizilite and TBlue630, we're providing you with the most thorough screening available. More than 25% of oral cancer victims have no life-style risk factors like tobacco, alcohol use, diabetes, or HIV. This is why we perform Vizilite Plus exams annually ... on all our patients age 18 and older.

Home Care 101: Mary (Hygienist)

Did you know that Seventy-Five percent of Americans over 35 have some form of Gum Disease? The progression of gum disease is usually painless. That is why most people do not realize they have it until it reaches an advanced level. Early detection of gum disease is critical, but with the appropriate therapy/treatment followed by meticulous homecare we can show or arrest the progression of gum disease. Homecare is the key to good oral health! Good homecare is more than just brushing your teeth. Good homecare is:

1. Gingival brushing (removing the plaque at the gum line & sulcus).
2. Flossing or using other interdental adjuncts to get in between teeth where your brush cannot reach (remember all gum disease & decay starts here).
3. Daily use of an antimicrobial rinse helps to eliminate bacteria that cause gum disease.
